Local correlations and global constraints

A: probe

Fixed local region
Charged operation
Untouched by recovery

B: buffer

Width l_B is varied
Mediates ordinary
short-range correlations

C: distant remainder

Can hold a global constraint
Invisible to separate probes
Correlated after conditioning

MI: what do A and C share without knowing B?

CMI: what remains shared when B is known?

Fixed parity: MI = 0, CMI = ln 2 for nonempty A, B, C covering the system.
